Hello Team,

Thank you for drafting this industry initiative towards Satellite Connectivity for Universal Services. It is a very pertinent topic for an emerging area.

My response is related to 3.1.6. Q5: other relevant dimensions section.
While Poland and NL have shared a point around energy consumption, sustainability is an important area for which all satellite providers need to create a framework for an economical solution.
There are a lot of edge industry use cases expected to be enabled through satellite driven connectivity.
Edge use cases will have either sensors or devices at the last mile connected to these satellite services.
Given that most consumer side devices may be in non-urban areas, providers can explore renewable power solutions such as solar for these devices to be more sustainable and self-powered.
This can also support more reasonable product pricing (mentioned in 2.1.3)
